BPO WORLD LIMITED | POS SYSTEM

UAT by Sitara Infotech

Point-by-point integration report aligned to the POS requirement list, mapped against the implemented product flow and the screenshot-backed UAT trail.

Compiled by Malik Amin | March 8, 2026

REQUIREMENTS	INTEGRATED	UAT CYCLES	LIVE STATUS
20	20	4	Ready
Tracked from POS.docx	Covered in product flow and UAT evidence	Core execution plus live revalidation	Validated against deployed workflow

LEAN UAT TIMELINE

The testing sequence moved from billing accuracy into service operations, then into exception handling, reporting, and final live refinement. Repeated scenarios were collapsed wherever a later test validated the same requirement more completely.

CYCLE 1

Billing integrity

Receipts, taxes, split tenders, dual totals and discounts validated.

CYCLE 2

Service operations

Table sessions, waiters, customers, pay-first flow and admin reporting validated.

CYCLE 3

Control layer

Void authorization, refunds, restricted-user access and Z-report flow validated.

CYCLE 4

Live refinement

March 7-8, 2026 updates tightened permissions, refund UX and settlement semantics.

SECTION I

Billing, tax and receipt integrity

Commercial correctness was validated first so every downstream flow rests on accurate pricing, tax treatment and bill presentation.

#	REQUIREMENT	HOW IT IS INTEGRATED	UAT TRAIL	STATUS
1	**Separate rates for items and extras on receipt** Receipts show base item price apart from add-ons.	Receipt and order breakdown preserve the base item and each modifier as distinct billable lines.	Test 1Receipt screenshots	INTEGRATED
2	**Payment-mode tax percentages apply by cash and card** Tax treatment changes by tender type.	Billing and settlement views calculate tender-sensitive totals so the operator sees the correct amount before closure.	Test 3Test 5Test 13	INTEGRATED

3	**Corrected tax rates of 16% cash and 5% card** Revised rates must flow into order and reporting outputs.	The configured rate structure is carried from payment through receipt and then into management summaries.	Test 3Settlement screenshots	INTEGRATED
4	**Partial cash and card payment reflected clearly** Split tender remains visible rather than being collapsed.	The payment flow stores split settlement transparently and prints the individual cash and card amounts back on the bill.	Test 3Bill screenshots	INTEGRATED
5	**Bill shows both cash and card options before payment** The operator sees both settlement outcomes up front.	The payment view exposes dual totals by tender, allowing commercial comparison before a method is selected.	Test 5Payment screenshots	INTEGRATED
6	**Different discount types available** Discounting remains configurable and controlled.	Discount controls are applied during billing and reflected into downstream totals while staying role-aware.	Test 5Test 15Live cashier retest	INTEGRATED

SECTION II

Dining room workflow, table flow and customer handling

The service layer validated table identity, consolidated dine-in settlement, waiter attribution and customer-linked ordering.

#	REQUIREMENT	HOW IT IS INTEGRATED	UAT TRAIL	STATUS
7	**Pay-after-eat dine-in with consolidated table bill** Multiple orders accumulate into a single table settlement.	Dine-in orders attach to an open table session so multiple sends can close on one final bill.	Test 4Table session screenshots	INTEGRATED
8	**Support both pay-after-eat and pay-before-eat models** Commercial mode is configurable.	Admin settings switch the order flow between normal settlement and pay-first enforcement.	Test 4Test 9March 8 live revalidation	INTEGRATED
9	**Order screen shows table number** Table-linked orders remain identifiable during service.	The active order and admin order card retain the table label for operational clarity.	Test 2Order screen screenshots	INTEGRATED
10	**Waiter or server assignment option** Service staff can be linked at order level.	Orders support waiter assignment so accountability and reporting can be tied back to the serving staff member.	Test 7Receipt and order screenshots	INTEGRATED

11	**Waiter-wise report** Reporting shows order count and value by waiter.	Admin reporting includes waiter performance visibility for management review of service output.	Test 10Reports screenshotsLive reporting validation	INTEGRATED
12	**Customer profile with walk-in default** Orders may attach to a known customer or remain walk-in.	Order and call-center flows support lookup, creation, history and default walk-in handling.	Test 8Call center flowLive sync retest	INTEGRATED

SECTION III

Voids, refunds and controlled actions

This block covers the exception path: why actions are allowed, how they are tracked, and how sensitive actions are contained.

#	REQUIREMENT	HOW IT IS INTEGRATED	UAT TRAIL	STATUS
13	**Void transactions appear separately in reports with reason** Void events remain auditable and visible in reporting.	Void handling records the event and its reason, then surfaces it separately from normal sales totals.	Test 6Test 11Void reason screenshots	INTEGRATED
14	**Void requires comment and password authorization** Voiding cannot remain a casual cashier action.	The void path requires comment capture and elevated authorization before execution.	Test 6Access retestLive permission hardening	INTEGRATED
15	**Refund option with complete tracking in pay-before-eat flow** Refunds are available and fully traceable.	Paid orders expose refund handling in the payment flow with refunded amount and transaction history preserved as a distinct audit event.	Test 14Live refund deploymentRefund screenshots	INTEGRATED
16	**Proper shift closing report with cash reconciliation** Drawer math and settlement closeout are visible in one flow.	The Z-report behaves as a settlement surface, reconciling cash in, change, refunds and expected balance.	Test 13Live settlement retestRefund-adjusted closeout	INTEGRATED
17	**User access controls for discount, void and refund** Sensitive actions respect role boundaries in UI and execution.	Role-based controls govern discount, void and refund access with restricted-user validation confirming blocked actions.	Test 15Cashier retestLive role sync	INTEGRATED

SECTION IV

Management reporting and daily visibility

The final block validates the reporting layer management uses to run the business day to day.

#	REQUIREMENT	HOW IT IS INTEGRATED	UAT TRAIL	STATUS

18	**Payment-mode-wise daily sales report** Management sees daily sales by tender type.	Daily reporting presents tender-level visibility with settlement-aware values for cash and card.	Test 11Test 13Live net-settlement validation	INTEGRATED
19	**Item-wise and category-wise sales reports** Management can analyze performance by mix and category.	The reporting layer includes item-level and category-level performance visibility beyond aggregate daily revenue.	Test 13Reporting screenshots	INTEGRATED
20	**Full daily sale summary with cash, credit, tax and net sale** Daily control view remains commercially coherent.	Admin summary and settlement reporting now present a coherent daily view across tender, tax, discounts, refunds and net sale.	Test 13Test 21Live summary refinement	INTEGRATED

EVIDENCE APPENDIX
